# Standard and compliance

SKF Chains are manufactured in state of the art facilities. Tight quality controls are employed to assure product conformance to the ISO standards and the existing industrial standards mainly ANSI, BS, DIN and JIS. SKF Oil field chains are American Petroleum Institute (API) approved and each box carries the API monogram. SKF automotive chain meets the ISO/TS16949 Quality Assurance System technical specification. This specification aligns american (QS-9000), german (VDA6.1), french (EAQF) and the italian (AVSQ) automotive quality system standards within the global automotive industry.

All SKF Chains have a normal operating temperature range of -20 to 150 °C. An exception are stainless steel chains with a range of -20 to 400 °C. For higher temperatures alternative lubrication should be applied. Please, also note that for temperatures over 200 °C and below -20 °C breaking load values are reduced.

## Raw material

The basic materials to make each component of the chain are critical hence strict controls of all incoming materials are implemented even before the production begins. These controls range from careful steel mills selection to constant auditing of the suppliers. Each batch of raw material received arrives with a laboratory report certifying the material composition. Samples are taken from incoming stock to be thoroughly analyzed to ensure that the chemical composition meets the factory's strict material specifications.

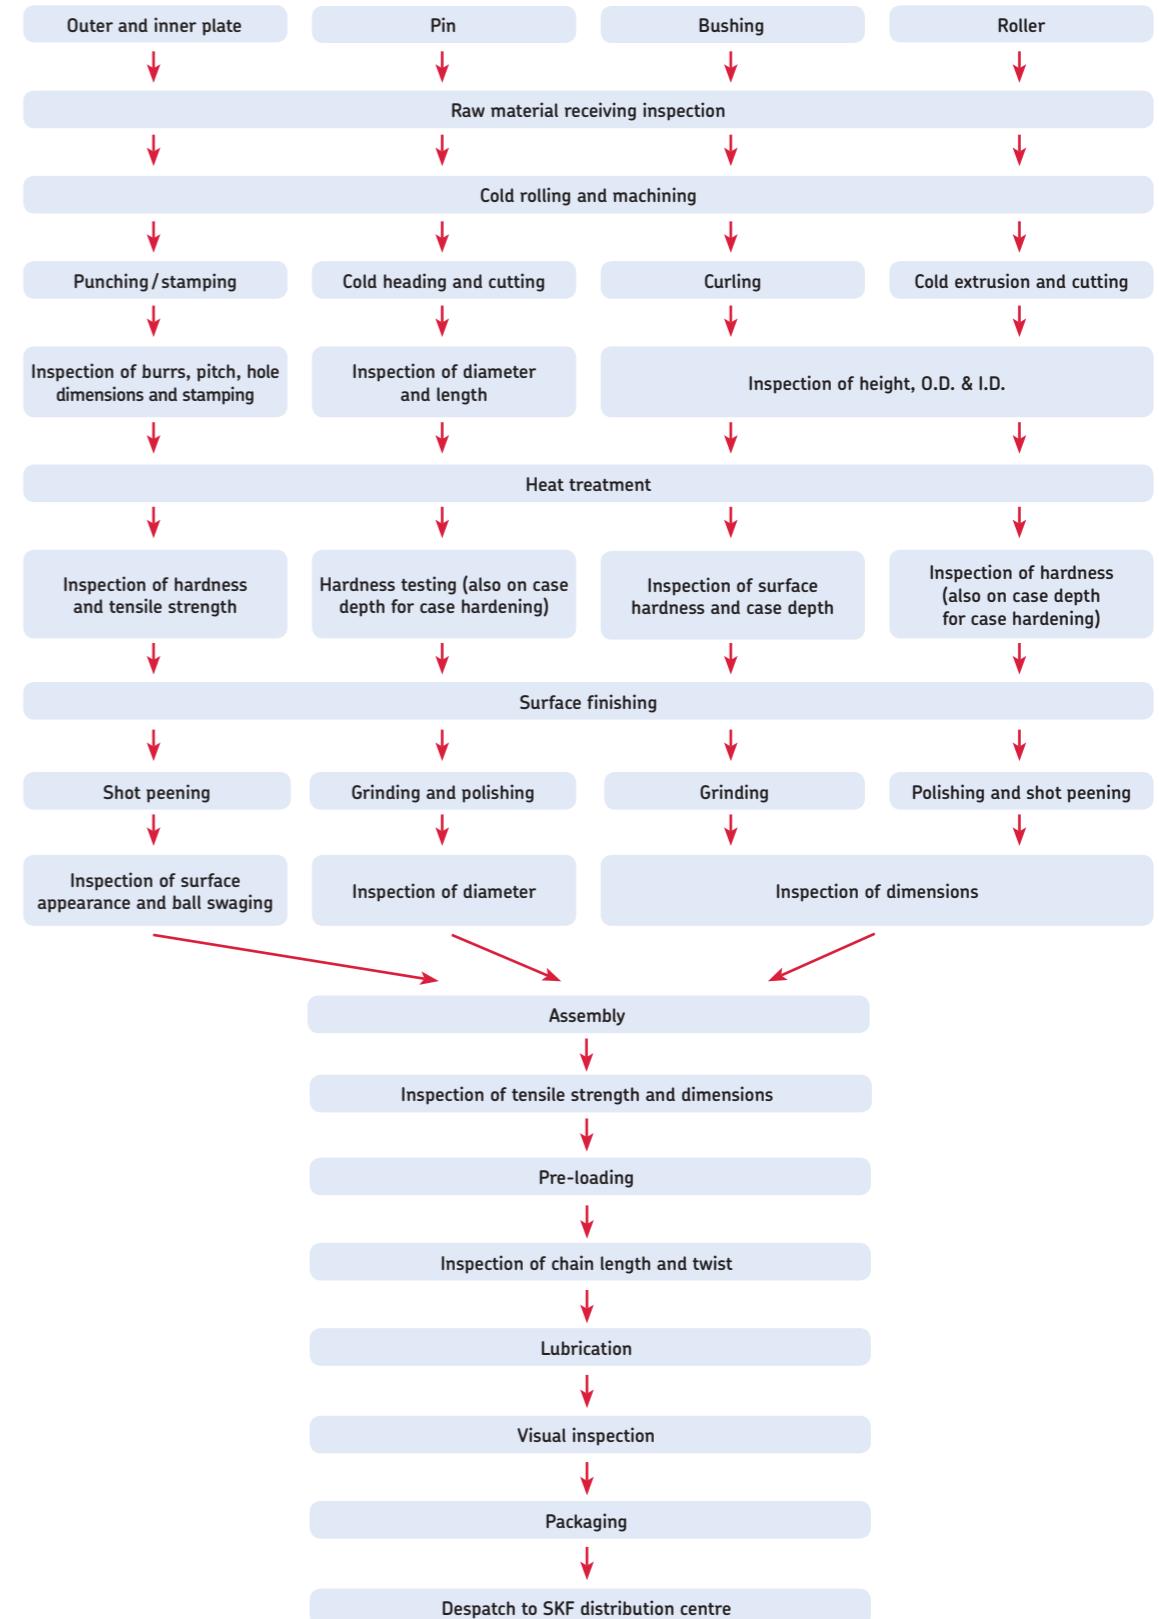

After stringent inspections, the materials will go through various pre-production treatments. Firstly, annealing is done in order to bring the materials to the perfect working condition followed by multi stage rolling which ensures the consistency in plate thickness. Various other processes are also carried out depending on individual material and part requirements.

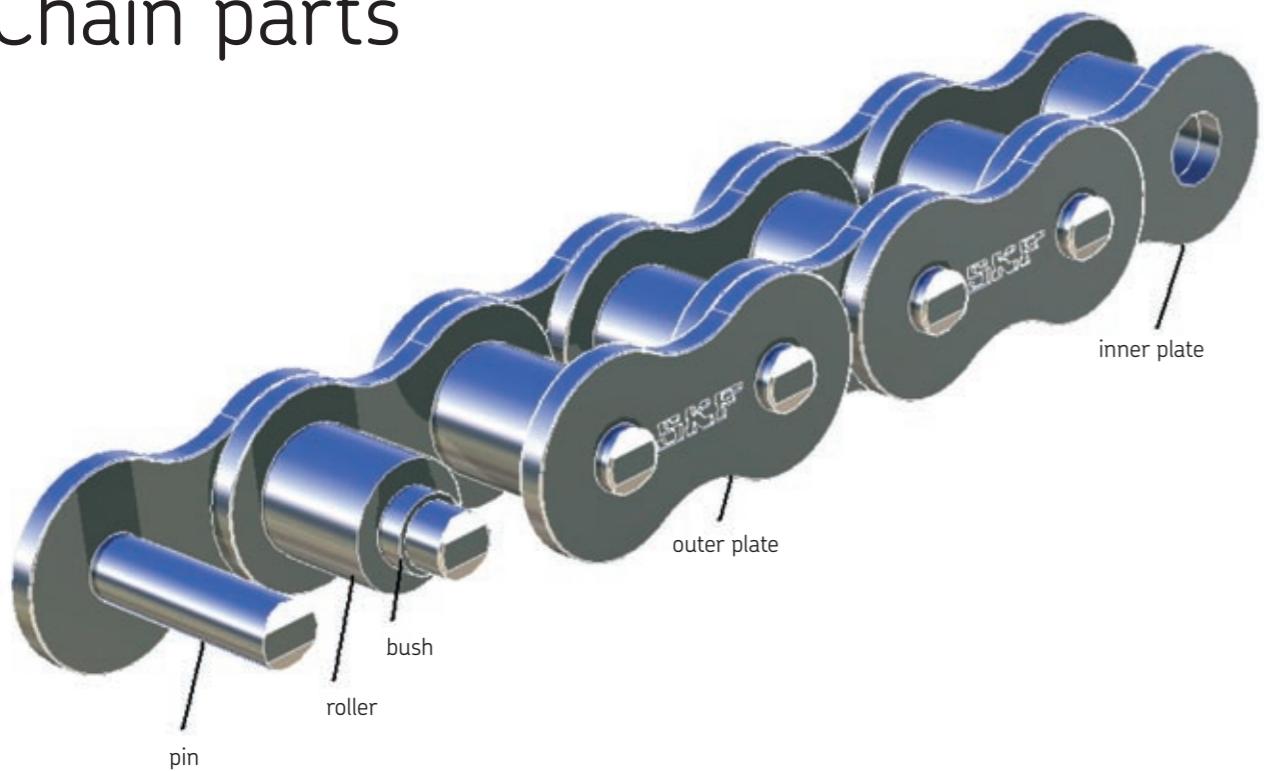

Continuous rolling machine to achieve uniform thickness of plate material

## The process

### SKF Chain manufacturing process Roller chain – manufacturing process and test operation

# Chain parts

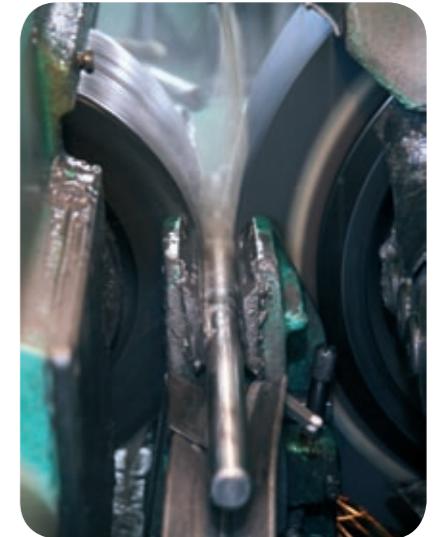

## Pin

The pin material is manufactured primarily from alloy steel and has a case hardened surface to give the maximum wear tolerance and a high strength tough core for better resistance to impact forces. These are achieved with rotary furnaces to ensure uniform heat dispersion on the pins during heat treatment. The pins are also precision ground to further enhance the wear resistance.

*Rotary furnaces are used for pin heat treatment to ensure uniform heat dispersion.*

*Pins are ground to thoroughly optimize the wear life.*

## Link plates (Inner and outer plates)

SKF Chains have adopted a wider waist link plate contour design, this increases the fatigue strength. By subjecting the raw material through a series of cold rolling processes and stringent thickness controls, the plates achieve uniform thicknesses which are critical to a smooth running chain. The plates endurance and strength is fully optimized via thru-hardening, shot peening and apertures ball-burnishing process.

*Shot peening parts improve fatigue and crack resistance*

*Furnaces for heat treatment process*

## Bushings

Cold rolling gives an overall uniform wall thickness which is extremely important in achieving a precise and consistent pitch. Precision curling units ensure that the inside and outside roundness of the bushings are controlled, for the optimum bush-link plate fit. The case hardening process gives the bushings high wear endurance with a tough impact resistant core. The bushings are then subjected to precision grinding to achieve long wear life.

*Conveyor furnace line used for roller and bushing heat treatment e.g. carbon-nitriding*

*Automated chain assembly to ensure proper fits and tolerances are met.*

## Rollers

SKF Chains use solid rollers that are cold extruded from bar stock, resulting in good fatigue strength and improved shock loading capabilities. All rollers go through a hardening process to ensure an extended wear life. To avoid crack propagation, shot peening is introduced, this also gives the rollers better fatigue strength which provides the required protection.

Parts manufacturing lines

Microhardness testing equipment where batch tests are done to ensure hardness is within specification

## Assembly process

Advanced automation machines ensure that the parts are assembled to the correct tolerances giving SKF Chains a precise spaced pitch with a perfect fit. Every part and process is subject to strict quality controls with frequent checks to ensure conformance to tolerances and standards. Depending on the requirements, various anti-corrosion treatments and special coatings are readily available upon request.

The assembled chains are then pre-stretched. This running in of the chain not only eliminates initial elongation but also increases the chain's fatigue resistance.

The final process of pre-lubrication provides SKF Chains with lubrication that is ready for the chains initial start-up. The pre-lubrication also acts as a corrosion protection for an assured long shelf life.

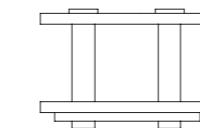

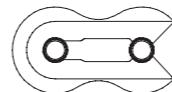

Pre-lubrication product line

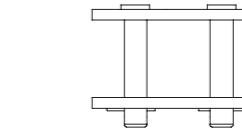

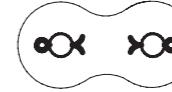

Pre-loading after final assembly

## Connecting links

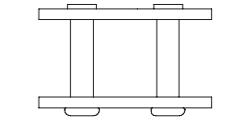

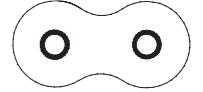

These links are used to connect two ends of a chain together to form an endless chain. The spring clip and cotter pin types enable easy dismantling and replacement of the chain while the rivet type provides a very strong link with similar fatigue strength to the other links in the chain.

Connecting link (spring clip type)

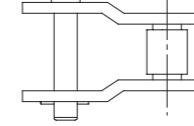

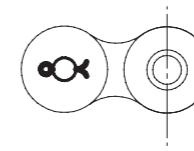

Connecting link (cotter pin type)

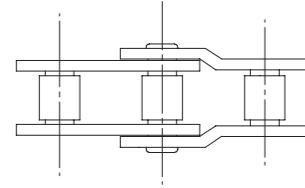

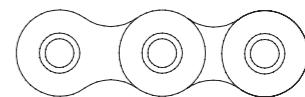

Connecting link (riveted type)

## Offset links

Offset links are used when an odd number of pitches are required in a chain. These links consist of two cranked plates which are press fitted onto a bush and roller. The wide end is placed over the last link in the chain and a connecting pin is installed and secured with a split pin.

Offset link

Double offset link

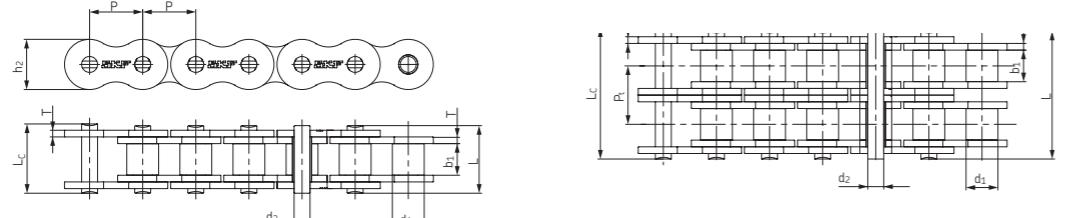

# American standard chains

American standard chains are covered by ISO 606, ANSI B29.1 and DIN 8188 standards.

The pitch sizes covered by this standard are 1/4 to 3 inch. American standard chains have a smaller pin diameter than the European standard equivalent. Wear resistance is therefore reduced when compared with the European standard chains with one exception, 5/8 inch pitch, in this case the pin and bushing diameters are larger than the European equivalent chain.

American standard chains are normally referred to under the ANSI standard numbering system, for example a 1/2 inch pitch duplex (double strand) chain would be, ANSI 40-2.

The ANSI numbering system works as follows: The first number is the pitch size in 1/8 inch, i.e. 4/8 = 1/2 inch pitch. The second number refers to the chain being a roller chain i.e. 0 = roller chain. A number 5 replacing the 0 would indicate a bushing chain and number 1 indicates a narrower series. The suffix, as with European standard chain, refers to the number of strands in the chain, that is 2 = duplex (double strand) chain.

# SKF Xtra Corrosion Resistance Chains

## Stainless steel chains

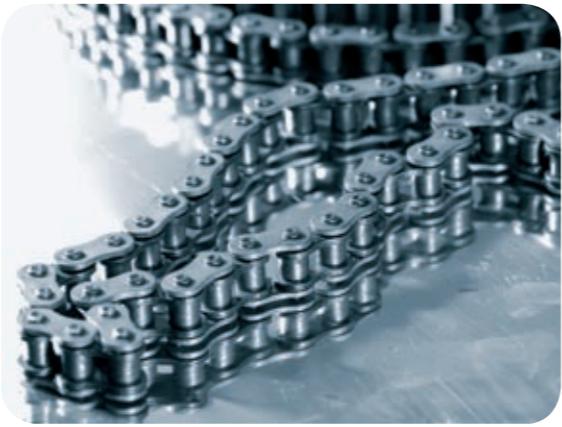

Stainless steel chains have superior corrosion resistance for the most demanding applications. SKF offers a variety of different stainless steel chains in order to suit the applications where cleanliness is required or harsh chemicals are used. SKF standard stainless steel chains are manufactured in SS304 grade steel for high corrosion resistance and are available in BS and ANSI standards. SS316 and other stainless steel grades are available for higher temperature applications. The SS316 stainless is somewhat more resistant to the effects of magnetic permeability, temperature extremes and harsher chemicals.

### Application

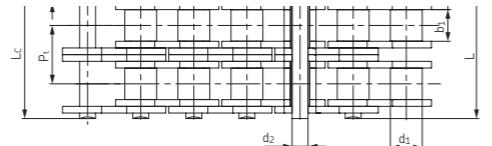

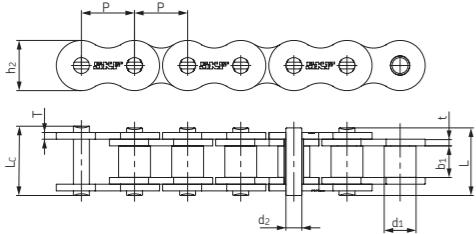

These chains are suitable for food processing, pharmaceutical, high/low temp (-20 to 400 °C) and corrosive environments. Stainless steel chains can be manufactured to withstand temperatures up to 1000 °C with the addition of special lubrication.

*Stainless steel chain used in a cheese processing plant*

*Anti corrosive chains are either made of stainless steel or are covered with a special coating*

\* Bushing chain: d<sub>1</sub> indicates external diameter of bushing

^ Straight side plates

Standard lengths are 10 ft and 5 m. To complete designation add chain length. For example, a 5 m box of 80-1SS is PHC 80-1SS5MTR. For links add "C/L" for "connecting" and "O/L" for "offset" to the designation in the table.

## Nickel-plated

Nickel-plated roller chains combine the strength of standard roller chains with the corrosion resistant properties that come from the nickel-plating. Nickel-plating of all components prior to the assembly assures a uniform coverage to produce the maximum effect of the plating process.

### Application

Nickel-plated chains are most commonly used for outdoor applications, or in a mildly corrosive atmosphere and might be used in an application that has limited contact with water.

*Nickel-plated chain used in a canning plant*

## Zinc-plated

Zinc-plated roller chains provide a very good adherence of the plating to the base metal and combines the strength of standard roller chains with the corrosion resistance that comes from zinc-plating. Zinc-plating of all components prior to assembly assures uniform coverage to produce the maximum effect of the coating process. Zinc-plating is more economical than nickel-plating.

### Application

Zinc-plated chains are most commonly used for outdoor applications and exposure to sea/salt water environments.

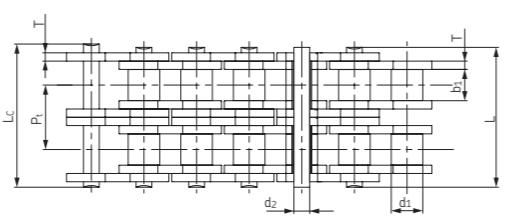

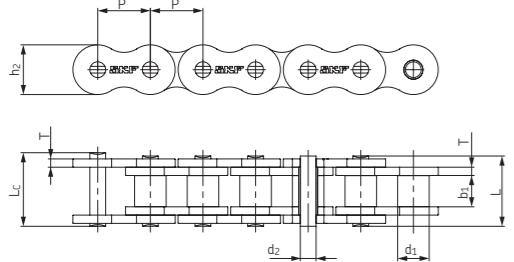

*Zinc-plated chains are often used in automatic car washes*

# Dacrotised chains

Dacrotising is a process of metal coating. The compositions are proprietary water based coating dispersions containing metal oxides, metallic zinc and aluminium flakes. The zinc and aluminium platelets align themselves in multiple layers forming a metallic silver gray coating. Overlapping zinc and aluminium flakes provide an excellent barrier of protection and the zinc corrodes to protect the steel. Due to the concentration of aluminum within the coating, good bi-metallic corrosion resistance with aluminum is accomplished. Damaged areas in the coating will fill with zinc oxides and carbonates and emerge as self repaired. The dacrotising process can be applied to numerous types of chains (Please contact SKF for specific requirements or types of chains).

## Application

These chains are suitable for extreme corrosive resistant environments without loss of strength.

Dacrotised chains used in a fish processing plant

\* Bushing chain: d<sub>1</sub> indicates external diameter of bushing

^ Straight side plates

Note: Duplex and double pitch plated chains are available in all sizes

When ordering plated chains suffix the Chain No. according to material selection;

DR = Dacrotised

NP = Nickel-plated

ZP = Zinc-plated

For example: PHC 50-1DR...

50-1 ANSI Simplex Dacrotised chain

PHC 60-2NP...

60-2 ANSI Duplex Nickel-plated chain

PHC 10B-1ZP...

10B-1 BS/ISO Simplex Zinc-plated chain

Standard lengths are 10 ft and 5 m. To complete designation add chain length. For example, a 10 ft box of 12B-1DR is PHC 12B-1DRX10FT  
For links add "C/L" for "connecting" and "O/L" for "offset" to the designation in the table.

## Attachments

Attachments are normally used to allow a chain to perform a conveying function. The holes in the attachments are normally used to join two strands of chain together to allow them to run as a pair. Hooks can also be inserted through the holes to allow the chain to carry objects. These attachments can also assist control systems by activating magnetic pickup or proximity switches.

### Attachments A-1, K-1

To complete designation add attachment spacing and type followed by chain length.

For example: PHC 80-1-L4WSA1X10FT (ANSI 80-1 with WSA-1 attachment on every fourth link, 10 ft length)

Note: Also available in stainless steel. When ordering suffix with SS, for example: PHC 80-1SS-L4WSA1X10FT

# SKF Xtra Strength Chains

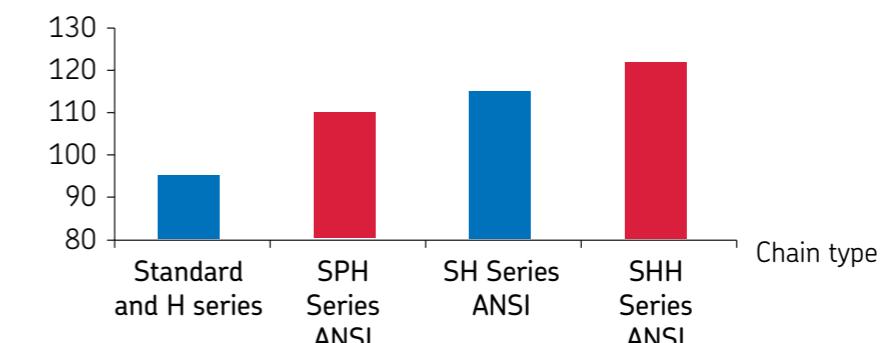

The use of tensile strength as a quality basis for chain performance is not entirely correct. While tensile strength is important to use in calculating the maximum chain pull, useful in lifting calculations, this does not always represent the fatigue life and performance of the chain.

The importance of the working load is particularly useful in heavy drive environments where significant shock loads are present. This in turn causes rapid elongation. This comes down to the hardness of the material used, the precision fit of the components as well as the overall size increase of the parts to offer a significant increase in allowable working load. This will in turn provide a much greater working life for the chain in demanding drive conditions.

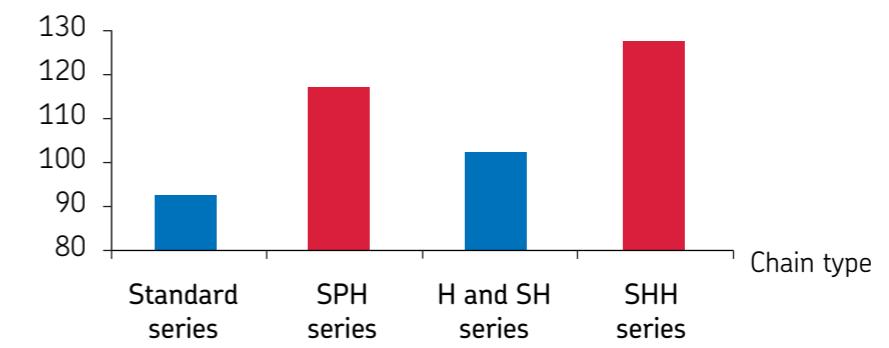

SKF Xtra Strength Chains used in logging applications

## Tensile strength comparison

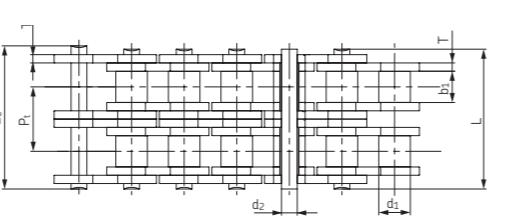

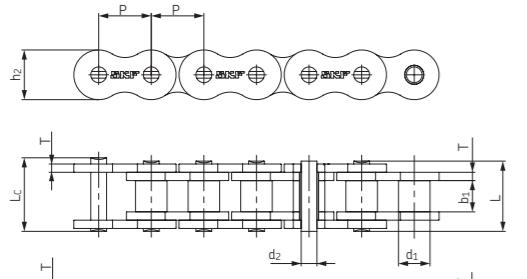

## Allowable load comparison

# SKF Xtra Strength H Chains

SKF Xtra Strength H Chains differ from standard ANSI chains slightly due to the fact that the thicker link plates correspond to the next larger size of ANSI roller chains. Therefore, H Series chains provide the capability to absorb approximately 10% higher shock loads. The ultimate tensile strength will be the same. SKF Xtra Strength H Chains which are especially suited to applications where shock loads are higher and operating speeds are lower as well as other severe operating conditions.

\* Bushing chain: d<sub>3</sub> indicates external diameter of bushing

For cottered add a "C" after the number of strands. For example 160H-1 with a cottered pin is designated PHC 160H-1C...  
Standard lengths are 10 ft and 5 m. To complete designation add chain length. For example, a 5 m box of 160H-1 is PHC 160H-1X5MTR  
For links add "C/L" for "connecting" and "O/L" for "offset" to the designation in the table

# SKF Xtra Strength SH Chain

SKF Xtra Strength SH Chains have a 25–35% greater ultimate tensile strength than ANSI heavy duty roller chains due to their thicker plates and thru hardened pins. These chains provide a greater shock load resistance and an improved service life whilst retaining the same dimensions as ANSI heavy duty series roller chains.

# SKF Xtra Strength SPH Chains

SKF Xtra Strength SPH Chains have link plates of a special design and pitch holes that are critically formed to precise tolerances that improve their allowable loads by 25–32%. The pins of this chain are thru hardened for greater shock load resistance. The dimensions of these chains are the same as ANSI standard roller chains.

SKF Xtra Strength SPH Chains used in the steel industry

Standard lengths are 10 ft and 5 m. To complete designation add chain length. For example, a 5 m box of 100SPH-1 is PHC 100SPH-1X5MTR.  
For "connecting" links add "C/L" to the designation in the table.

# SKF Xtra Strength SHH Chains

SKF Xtra Strength SHH Chain's link plate thickness is usually equal to the next larger size of SKF Xtra Strength SPH Chains. Its pins are also thru hardened. The use of higher grade materials results in chains that have greater ultimate tensile strength and allowable load than SKF Xtra Strength SH Chains.

SKF Xtra Strength SHH Chains used in construction machinery

# SKF Xtra Performance SLR Chains

The method of achieving internal lubrication of the chains is by high quality oil impregnation of the components during their manufacture and is known as sintering. The steel bushings are forged with lubricant within the material structure of the steel. During this operation, the lubricant forms a micro thin layer between the pin and internal roller surfaces.

Self-lubricating chains provide excellent wear life without further lubrication. In addition self-lubricating chain pins are nickel-plated to ensure a very smooth running surface that will not wear the self-lubricating bushes and will provide a long term, internal lubrication. The link plates are black phosphate coated. The self-lubricating chains are interchangeable with standard roller chains.

In some applications using self-lubricating chains, the amount of time to elongate when compared with non lubricated standard chains, have seen life increases from 5 – 10 times, further increasing machine up-time and reliability. These chains can also be used as a base chain for attachment chains, which are commonly required in the printing and packaging industries.

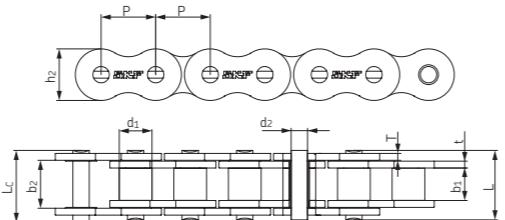

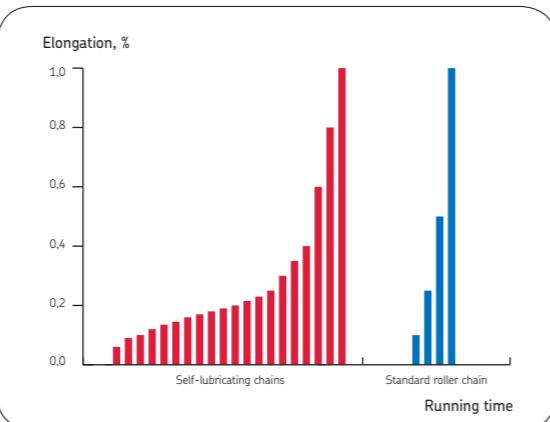

## Application

As self-lubricating chains do not require lubrication they are suitable for applications where lubrication is not possible or practical and these chains can offer a long-lasting maintenance free solution. Contamination of the final product from oil spillage or oil mist is a major reason for the lubrication-free demand in the paper, packaging, electronics, white and brown goods manufacturing sectors. In addition, if lubrication can be avoided altogether then planned lubrication intervals are unnecessary and maintenance costs are reduced accordingly.

SKF Xtra Performance SLR Chains used on food processing machinery

## SKF Xtra Performance SLR Chains vs standard chains

Standard lengths are 10 ft and 5 m. To complete designation add chain length. For example, a 10 ft box of 10B-1SLR is PHC 10B-1SLRX10FT. For links add "C/L" for "connecting" and "O/L" for "offset" to the designation in the table.

# Side bow chains

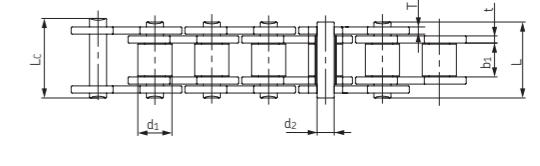

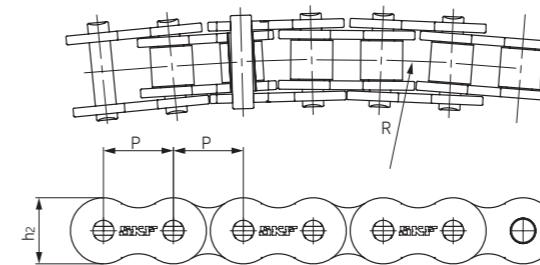

Side bow (curved) chains are able to flex and twist due to extra clearance between the inner and outer side plates. They are ideal for use on curved conveyors or to transmit power under misaligned sprocket conditions. They are produced with barrel shaped pins and additional pin, bushing and link plate clearances. These features allow travel in a curved path and/or chain twist.

## Application

Side bow chains are commonly used in curved track conveyors in the bottling, packaging, canning and textile industries.

Standard lengths are 10 ft and 5 m. To complete designation add chain length. For example, a 5 m box of 60-1SB is PHC 60-1SBX5MTR. For links add "C/L" for "connecting" and "O/L" for "offset" to the designation in the table.

# Hollow pin chains

Hollow pin chains offer flexibility to end-users as cross rods or extended pins may be easily inserted. Ideal for setups where spacing of cross rods or pins must be changed frequently.

These chains are also available in carbon steel and stainless steel.

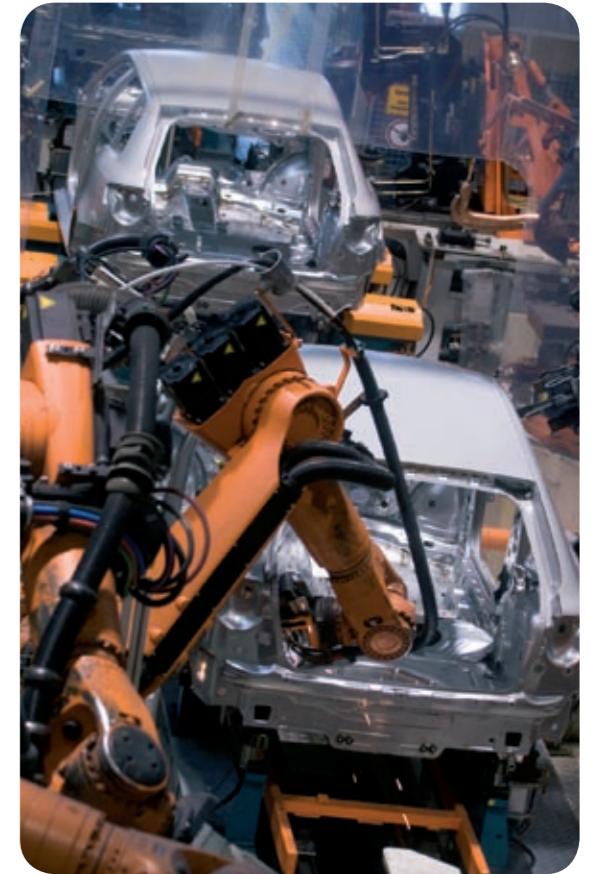

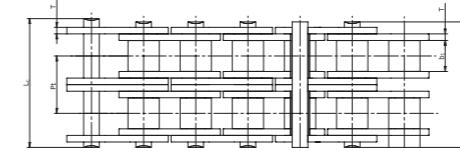

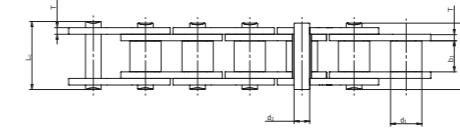

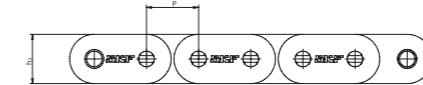

Hollow pin chain used on a newspaper conveyor

Standard lengths are 10 ft. To complete designation add chain length. For example, a 10ft box of 08-B-1HP is PHC 08B-1HPX10FT.

# Straight side plate chains

Straight side plate chains possess flat, rather than contoured link plates, for better sliding properties in conveyor applications. The fatigue strength and chain weight are slightly higher than for standard chains.

Straight side plate chain used in the automotive industry

Standard lengths are 10 ft. To complete designation add chain length. For example, a 10ft box of C08B-1 is PHC C08B-1X10FT.

## Double pitch roller chains

Double pitch roller chains are produced in accordance with the ASME/ANSI B29.3 (transmission series) and B29.4 (conveyor series) american roller chain standards. In general, these chains are dimensionally similar to ASME/ANSI standard products except that the pitch is double. They are available in the transmission series and the conveyor series with standard sized rollers, and the conveyor series with large (oversized) rollers. This chain is an economical choice for low speed; moderate load and long centre distance drive applications including a variety of conveyor systems and material handling equipment.

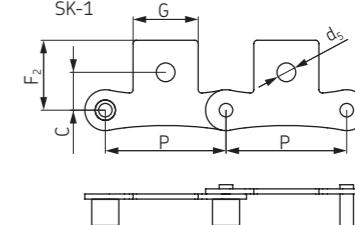

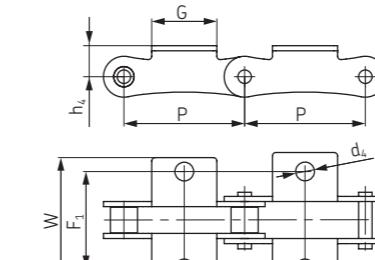

Double pitch roller chains used in agricultural applications

Standard lengths are 10 ft and 5 m. To complete designation add chain length. For example, a 5 m box of 2060 is PHC 2060X5MTR. For links add "C/L" for "connecting" and "O/L" for "offset" to the designation in the table

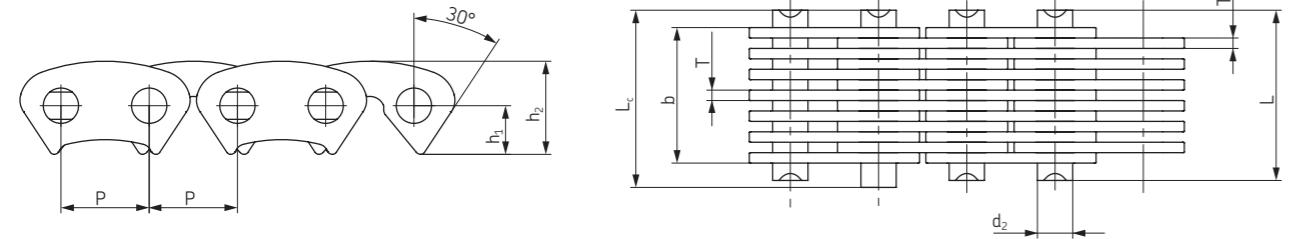

# Silent chains

Silent chains (or inverted tooth chains) are manufactured to GB10855 (equivalent to SC Series silent chains ANSI B29.2M), which are most commonly used for industrial applications. All silent chains are made up of stacked rows of flat, tooth shaped driving links that mesh with sprockets having compatible tooth spaces, similar to a rack and pinion mesh. Typically, chains will also contain guide links, whose purpose is to maintain proper tracking of the chain on the sprockets. Washers or spacers may be present in some chain constructions. All of these components are held together by riveted pins located at each chain joint end. Pin and rocker joint design minimizes heat and allows for low wear rates during power transmission. These chains transmit power smoothly, efficiently and economically.

## Application

Silent chains offer unique advantages and options in both power transmission and conveying applications. In power transmission applications silent chains are capable of transmitting loads and speeds that exceed the capability of all other chains and belts. Drives are compact and efficient, operating with little noise or vibration. In conveying applications silent chain provides a durable, heat resistant, non-slip, flat, conveying surface that runs with a nearly constant linear velocity. The range of available sizes is extensive.

# Oil field chains

Oil field chains are used in oil industry applications where there are extreme loads and the operating conditions are very harsh. They are especially made to withstand heavy shock loads and extreme drive conditions. These chains provide a highly efficient way of transmitting power and no large radial loads, thrusts or bearing pressure are generated thus the entire drive system is smaller and less costly.

The installation and maintenance are easy and simple. These special chains have the distinctive "crook shank" pins to allow for easy assembly and dismantling.

Multiple strands of oil field chain inside a mud pump

Standard lengths are 10 ft. To complete designation add chain length. For example, a 10 ft box of 40S-6 is PHC 40S-6X10FT  
For links add "C/L" for "connecting" and "O/L" for "offset" to the designation in the table

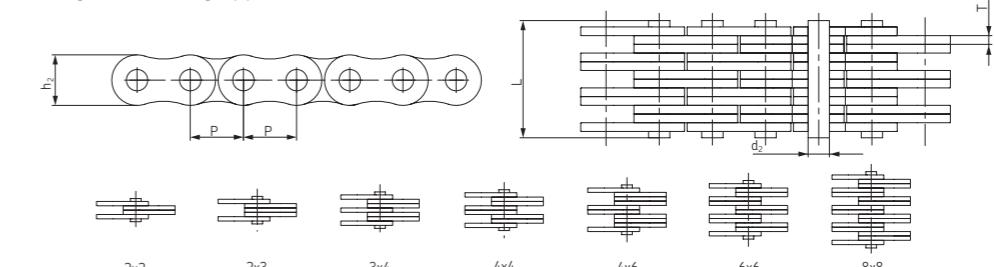

# Leaf chains

Leaf chains are designed for high load, slow speed tension linkage applications. Often they are specified for reciprocating motion lifting devices such as fork lifts, or as counterweight chains for elevators or telescoping equipment such as cranes. The chains are typically supplied to a specific length and connected to a clevis at each end. The clevis may accommodate "male" ends (inside links) or "female" ends (outside links) as required.

Leaf chains are available in series; AL, BL, LL, FL, 12XX, 15XX, 19XX and 25XX. The AL and BL series are based on american standard chains, while the LL series is based on british standard chains. BL series leaf chains are made according to the ASME/ ANSI B29.8 american standard. LL series leaf chains are made in accordance with the ISO 606 international standard. A chain with an even number of pitches has one male and one female end. A chain with an odd number of pitches may have either two male or two female ends.

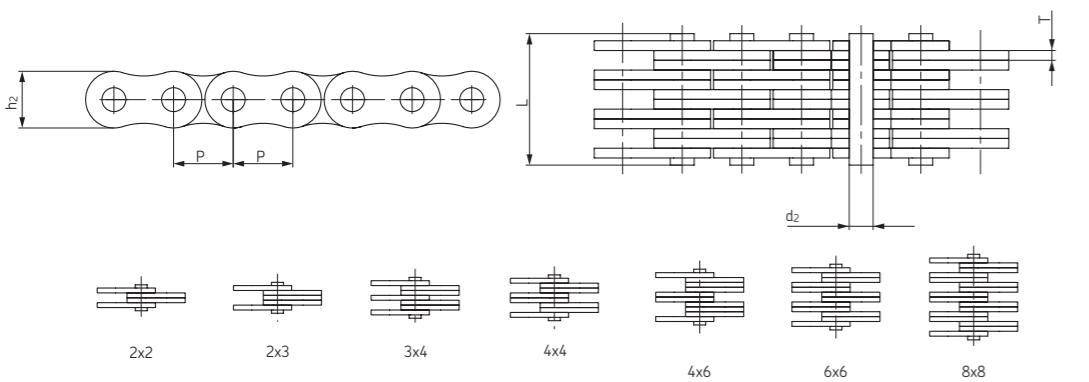

## Application

The applications of these chains are counterweight chain for masts, elevator and oven doors, forklift truck masts, spinning frames and any other lifting or balancing application.

# Maintenance decrease

SKF Power transmission and Maintenance Products together help you mount, lubricate, align and maintain your application more efficiently.

## Chain drives

By using high quality steel and paying careful attention to details in the manufacturing process SKF Chains are built for endurance. Specialized chains such as the Dacromet coated chain allow chains to be run for longer in the most corrosive surroundings.

## Pinpoint accurate shaft alignment simply achieved

The SKF shaft alignment tools TMEA Series offer you simplicity with a high degree of accuracy. These highly innovative tools feature a three-step process for correcting alignment:

Measuring, aligning and documenting.

First, measure the machinery's current alignment status.

Then align the machine vertically and horizontally. Finally, document and keep track of the alignment activities.

These three simple steps allow you to easily and effectively align shafts using advanced laser technology.

- Compact, lightweight design
- Spirit levels allow easy and fast positioning of the measuring units
- Selectable mm or inch reading of measurement facilitates worldwide use
- Supplied in sturdy, lightweight carrying cases for portability
- Supplied with high precision SKF pre-cut shims for accurate alignment

## Extend your chain life with the oil range from SKF

SKF Chain oils come in three convenient sizes to suit the needs of most chain applications in industrial environments.

The chain oils, medium temperature, high temperature and food compatible (NSF H1), are available in 400 ml (13.52 oz.) aerosol cans, 5 liter (1.32 gallon) cans, and as an oil fill for SYSTEM 24® single point automatic lubricator.

# Design Optimization

The most efficient and economical solution for your drive can now be calculated and also be documented.

SKF is the first industrial company to offer its customers on-line calculation tools for both belt and chain drive designs. Visit [www.skfptp.com](http://www.skfptp.com) for free access and a wide choice of languages.
